

## WORLD ENERGY OUTLOOK

**World Energy Outlook 2013** 

London, 12 November

## The world energy scene today

### Some long-held tenets of the energy sector are being rewritten

- Countries are switching roles: importers are becoming exporters...
- > ... and exporters are among the major sources of growing demand
- New supply options reshape ideas about distribution of resources

### But long-term solutions to global challenges remain scarce

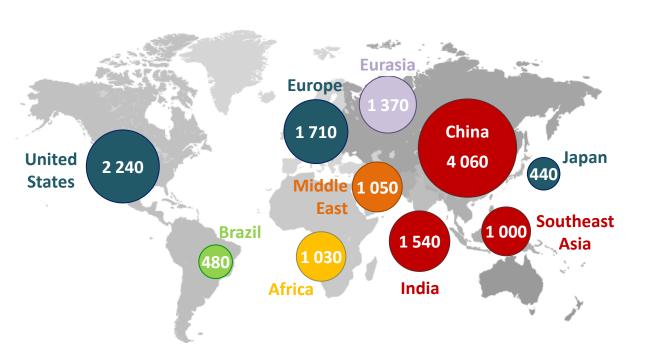

- > Renewed focus on energy efficiency, but CO<sub>2</sub> emissions continue to rise
- > Fossil-fuel subsidies increased to \$544 billion in 2012
- > 1.3 billion people lack electricity, 2.6 billion lack clean cooking facilities

### Energy prices add to the pressure on policymakers

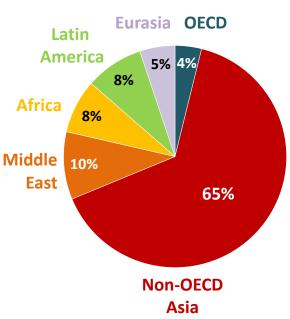

- Sustained period of high oil prices without parallel in market history
- Large, persistent regional price differences for gas & electricity

## The engine of energy demand growth moves to South Asia

**Primary energy demand, 2035** (Mtoe)

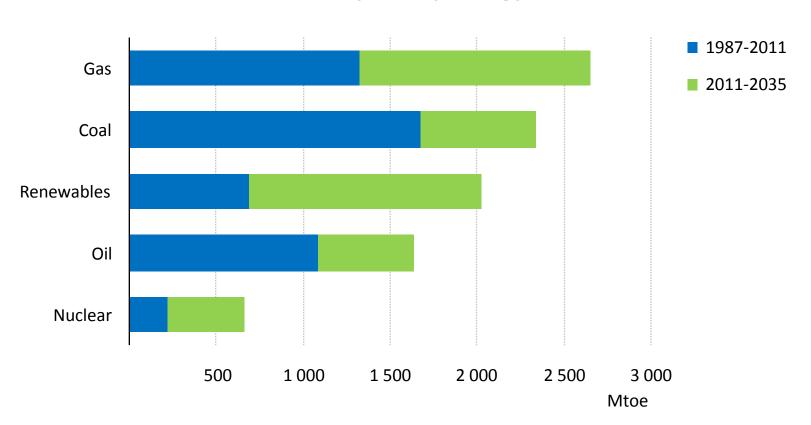

## Share of global growth 2012-2035

China is the main driver of increasing energy demand in the current decade, but India takes over in the 2020s as the principal source of growth

## A mix that is slow to change

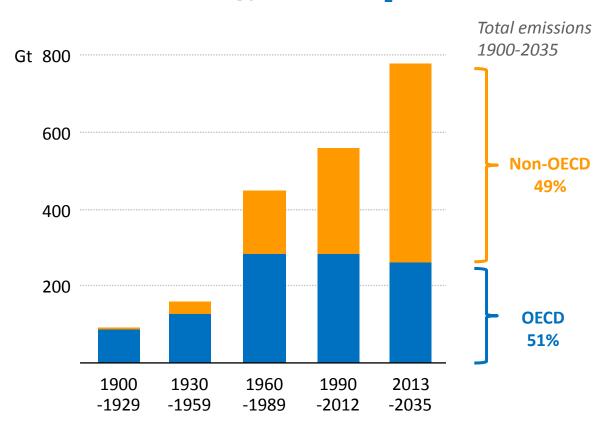

### **Growth in total primary energy demand**

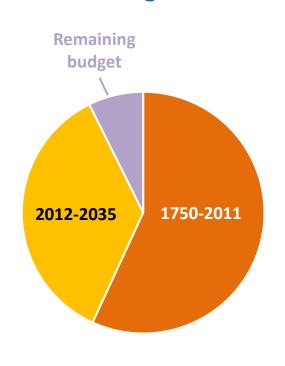

Today's share of fossil fuels in the global mix, at 82%, is the same as it was 25 years ago; the strong rise of renewables only reduces this to around 75% in 2035

## Emissions off track in the run-up to the 2015 climate summit in France

#### **Cumulative energy-related CO<sub>2</sub> emissions**

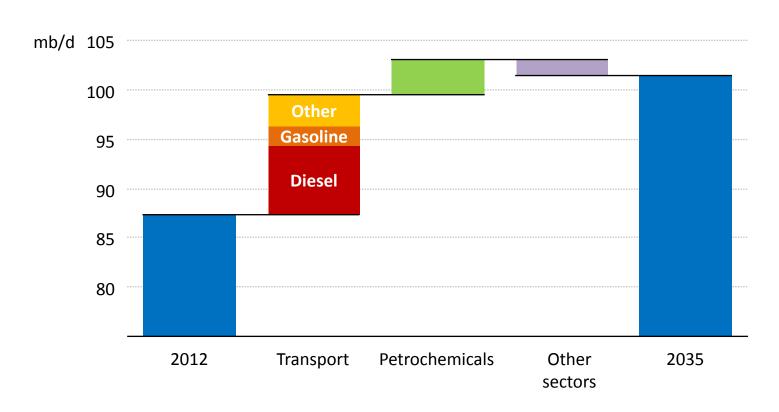

#### 'Carbon budget' for 2 °C

Non-OECD countries account for a rising share of emissions, although 2035 per capita levels are only half of OECD; the 2 °C 'carbon budget' is being spent much too quickly

# Oil use grows, but in a narrowing set of markets

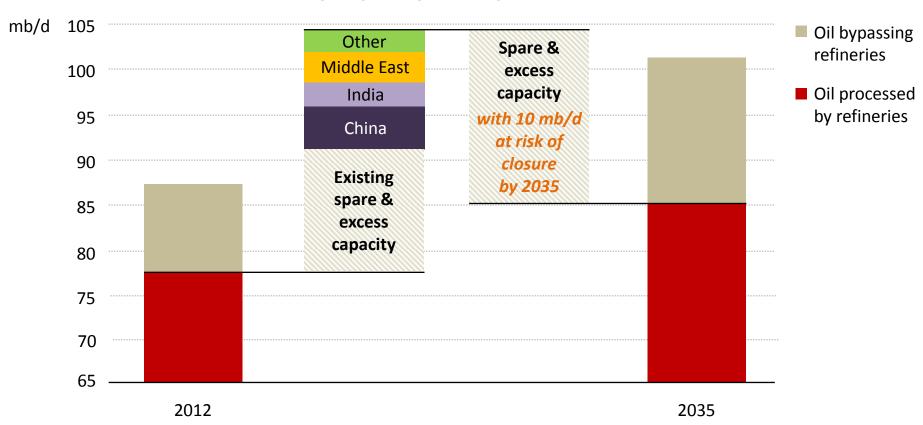

#### Oil demand by sector

China becomes the largest consumer of oil by 2030, as OECD oil use drops; demand is concentrated in transport, where diesel use surges by 5.5 mb/d, & petrochemicals

## Turbulent times for the refining sector

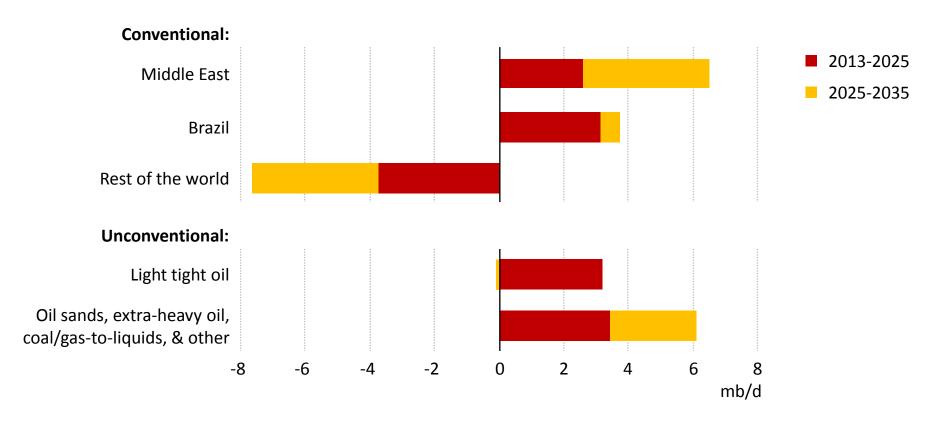

#### Refinery capacity and operation

More oil bypassing the refining system and new capacity in growing non-OECD markets piles pressure on existing refiners, especially in Europe

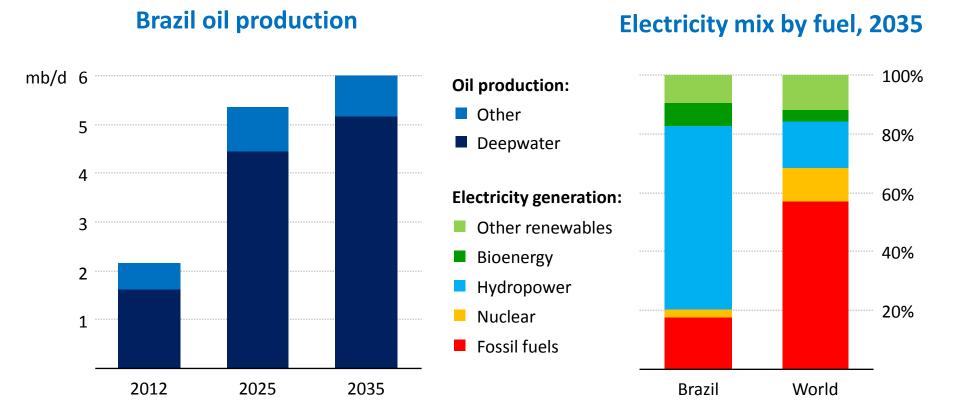

## Two chapters to the oil production story

#### Contributions to global oil production growth

The United States (light tight oil) & Brazil (deepwater) step up until the mid-2020s, but the Middle East is critical to the longer-term oil outlook

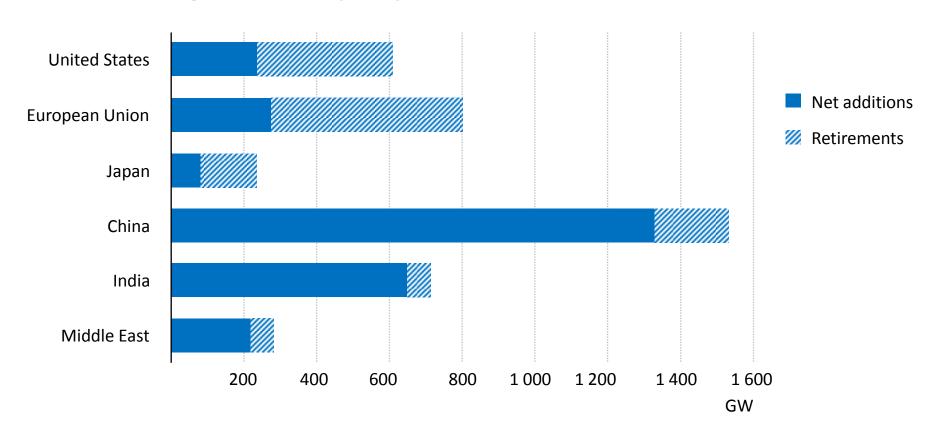

## **Brazil cuts a distinctive profile**

Complex deepwater projects see Brazil joining the top ranks of global oil producers, while the domestic power mix remains one of the least carbon-intensive in the world

## **Capacity to change?**

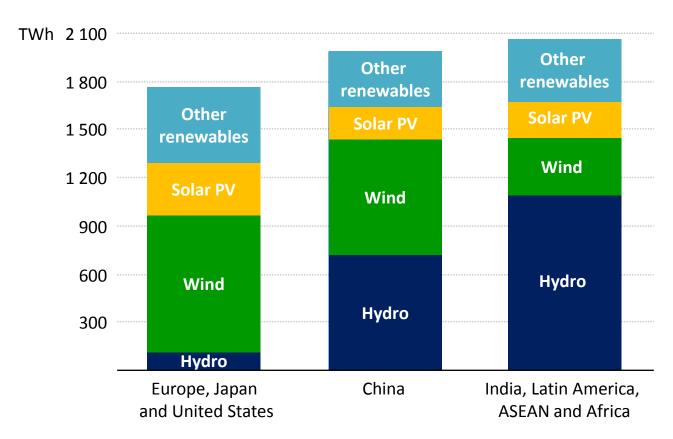

#### Power generation capacity additions and retirements, 2013-2035

China & India together build almost 40% of the world's new capacity; 60% of capacity additions in the OECD replace retired plants

## Renewables power up around the world

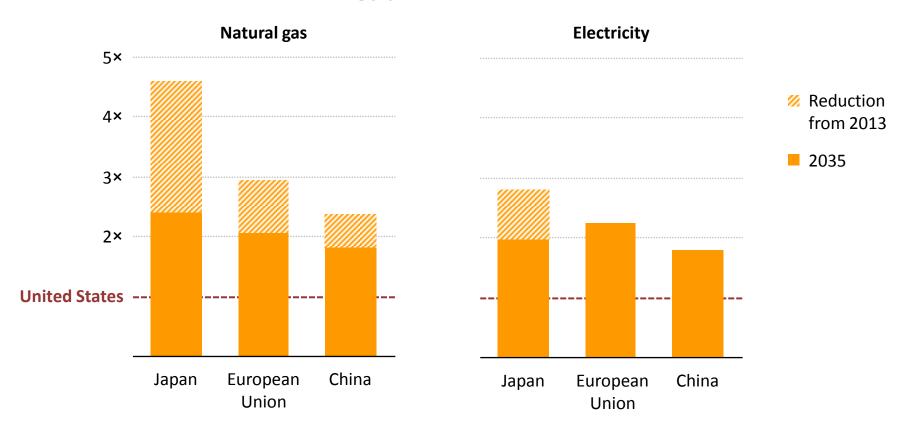

#### **Growth in electricity generation from renewable sources, 2011-2035**

The expansion of non-hydro renewables depends on subsidies that more than double to 2035; additions of wind & solar have implications for power market design & costs

## Who has the energy to compete?

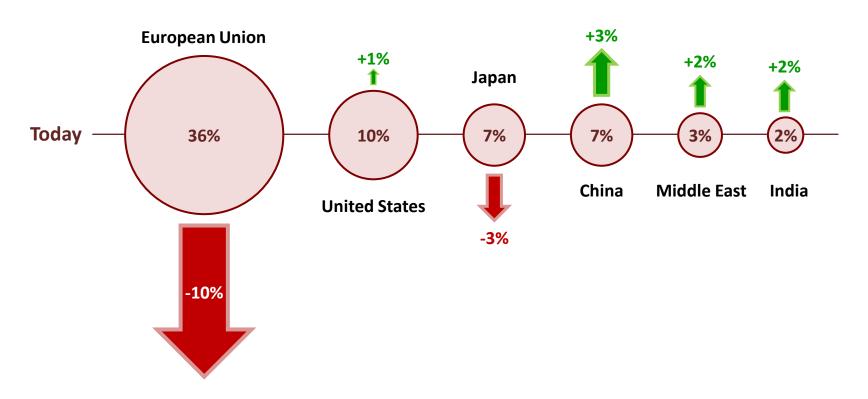

#### Ratio of industrial energy prices relative to the United States

Regional differences in natural gas prices narrow from today's very high levels but remain large through to 2035; electricity price differentials also persist

## An energy boost to the economy?

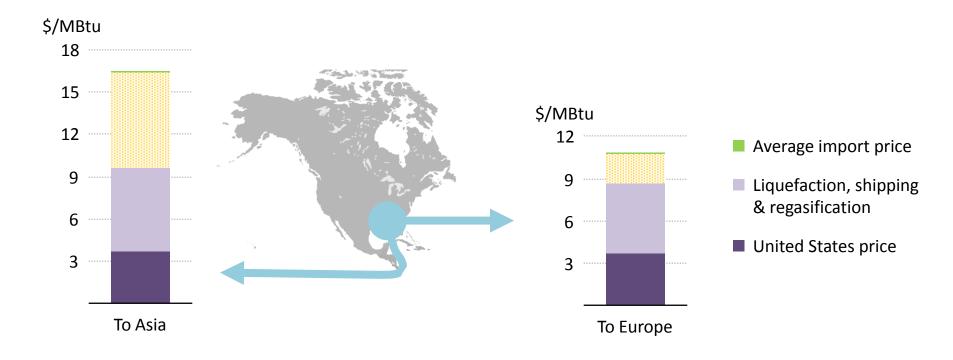

#### Share of global export market for energy-intensive goods

The US, together with key emerging economies, increases its export market share for energy-intensive goods, while the EU and Japan see a sharp decline

# LNG from the United States can shake up gas markets

#### Indicative economics of LNG export from the US Gulf Coast (at current prices)

New LNG supplies accelerate movement towards a more interconnected global market, but high costs of transport between regions mean no single global gas price

## Orientation for a fast-changing energy world

- China, then India, drive the growing dominance of Asia in global energy demand & trade
- Technology is opening up new oil resources, but the Middle East remains central to the longer-term outlook
- Regional price gaps & concerns over competitiveness are here to stay, but there are ways to react – with efficiency first in line
- The transition to a more efficient, low-carbon energy sector is more difficult in tough economic times, but no less urgent
